

## Auto Click

The **Auto Click** program is a very practical and useful tool that helps you repeatedly click on a specific coordinate, or simply create a drag and mouse click macro during a given period. With that, you can save time and a lot of effort when you need it is performing a repetitive task. And it can still help you without being in front of your computer.

The program is very intuitive, you will first need to define a shortcut key, because during the activity period, your mouse may be performing some task.

Like this program, you can, for example, prevent the screen saver or the hibernation of the screen or computer from being activated, imagine this when your computer has some rules defined by **GPO** (Group Policy) and does not allow you to disable these options on your computer. Or if you are in a game like Roblox and need to perform some repetitive task with the mouse.

The **Auto Click** program is quite simple, don't you think?
